ABSTRACT

Artificial Neural Network-Based Robotics

Justin Ng

Artificial neural networks (ANNs) are highly-capable alternatives to traditional problem solving schemes due to their ability to solve non-linear systems with a non-algorithmic approach. The applications of ANNs range from process control to pattern recognition and, with increasing importance, robotics. This paper demonstrates continuous control of a robot using an actor-critic algorithm based on deep deterministic policy gradients (DDPG) originally conceived by Google DeepMind. The robot performs tasks such as locomotion within an enclosed area and object transportation. The paper also details the robot design process and explores the challenges of implementation in a real-time system.

Chapter 1

MECHANICAL DESIGN

1.1 Introduction

The robot meets the design specification shown in Table 1.1. It consists of four subassemblies: the base platform, shooting mechanism, ball hopper, and control unit. Each section was first modeled in SolidWorks, an industry-standard solid modeling CAD program. The designed parts were then fabricated using a laser cutter or 3D printer and assembled with metric hardware. Figure 1.1 displays a photograph of the robot while Figures 1.2 through 1.5 show standard view renders of the SolidWorks model. Note that the robot uses mecanum wheels (a type of omni-directional wheel) which are modeled as plain wheels for simplicity. Figure 1.3 also indicates the front, left, back/rear, and right sides of the robot as referenced in the rest of the paper. The robot contains 53 unique parts, of which 24 are custom designed, and 394 parts in total. The bill of materials can be found in Appendix A.

Table 1.1: Roborodentia 2018 Mechanical Requirements

Requirement
1 Maximum footprint of 12" x 14" or smaller at start of match but may expand up to 14" x 17" during match.
2 Maximum height of 14" at start of match but no restriction during match.
3 Robot may not disassemble into multiple parts.
4 Robot may not be airborne.
5 Shooting mechanisms may not accelerate balls past 50 feet per second.

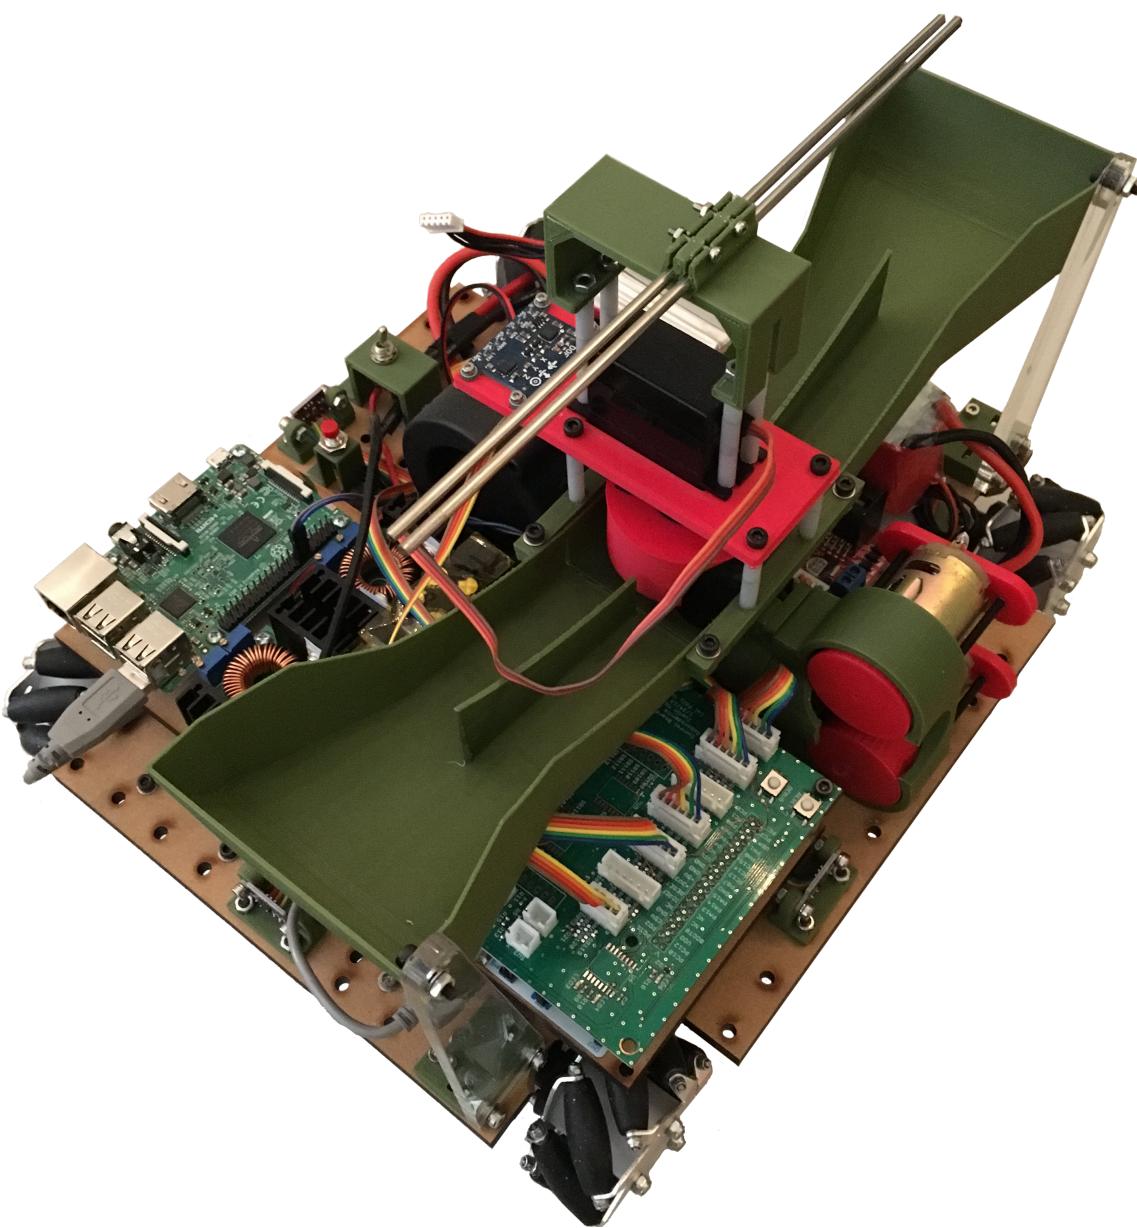

Figure 1.1: Photograph of Robot

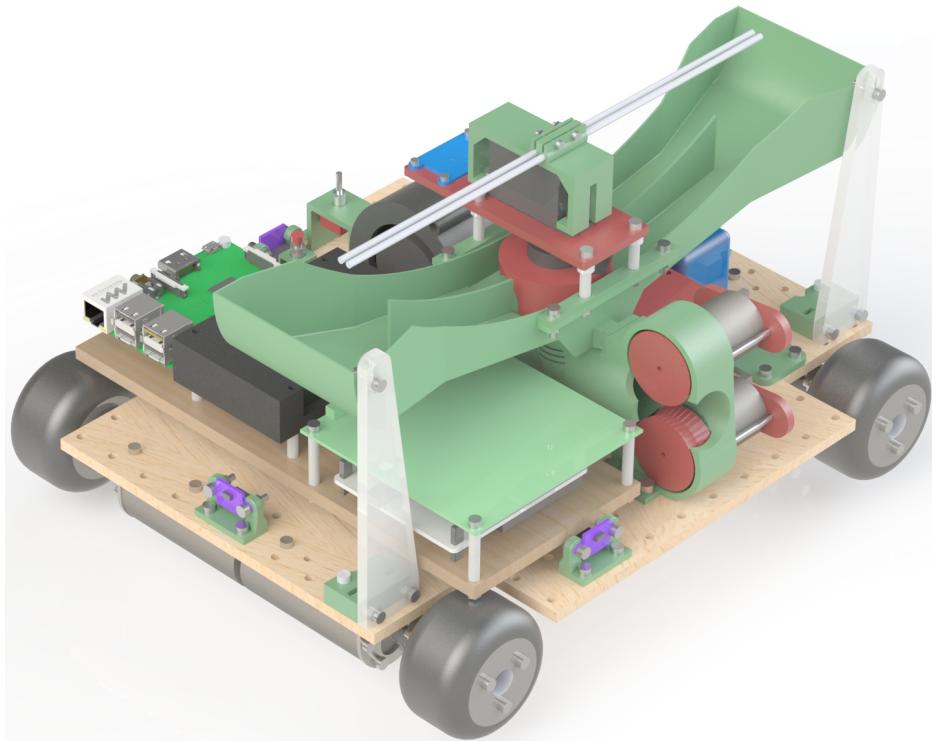

Figure 1.2: Full Robot Render – Isometric View

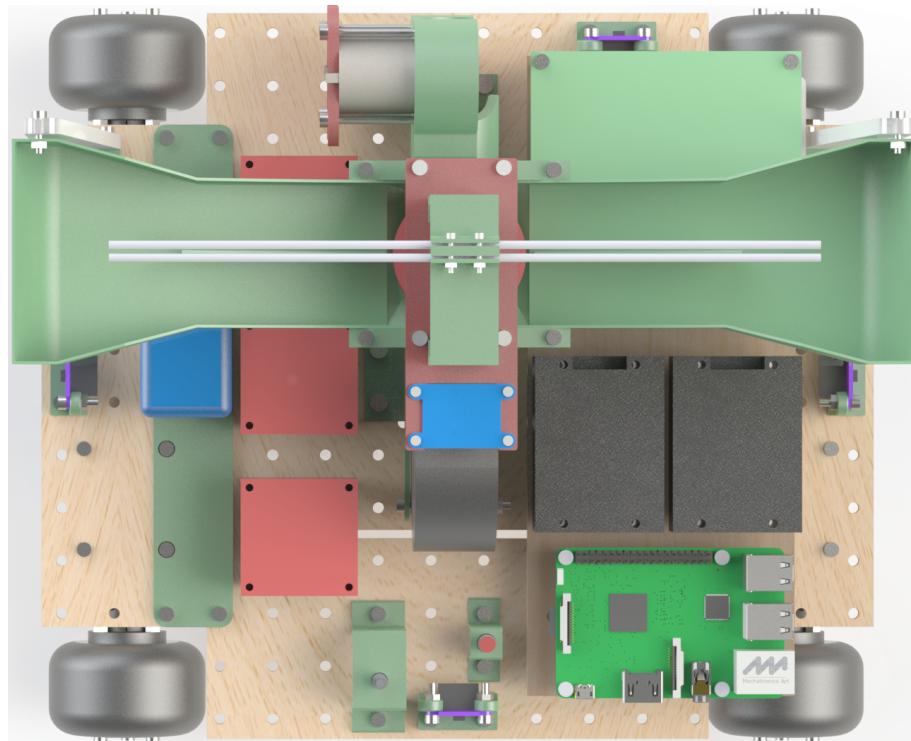

Figure 1.3: Full Robot Render – Top View

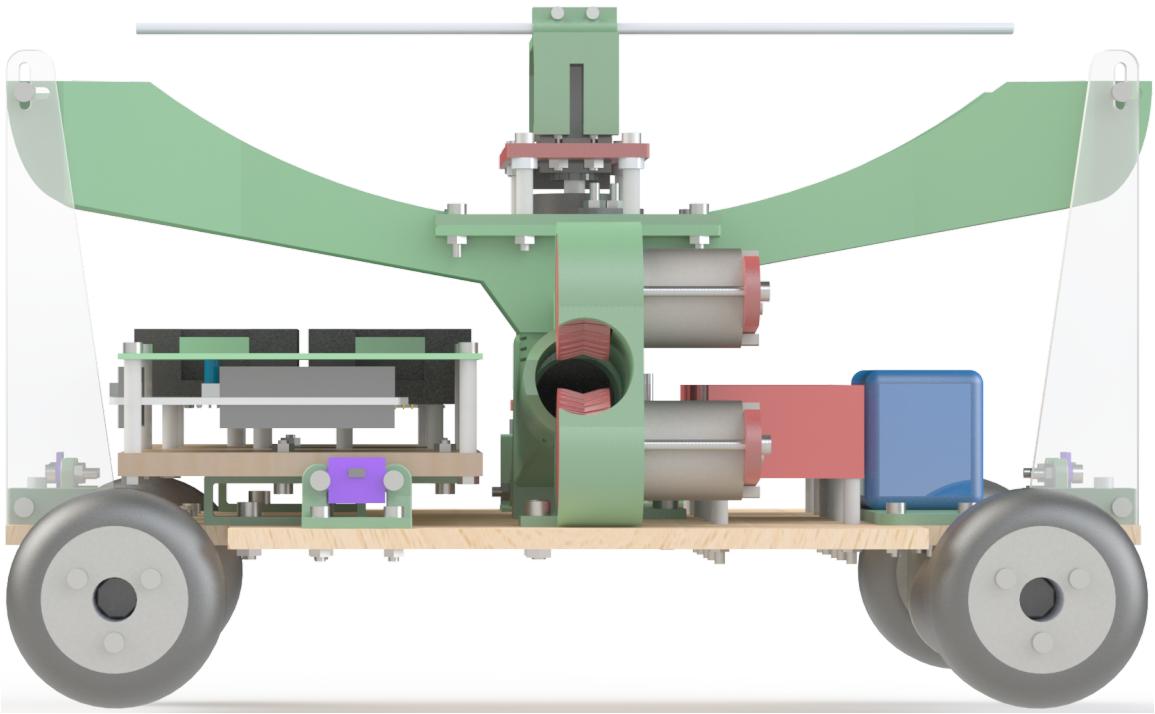

Figure 1.4: Full Robot Render – Front View

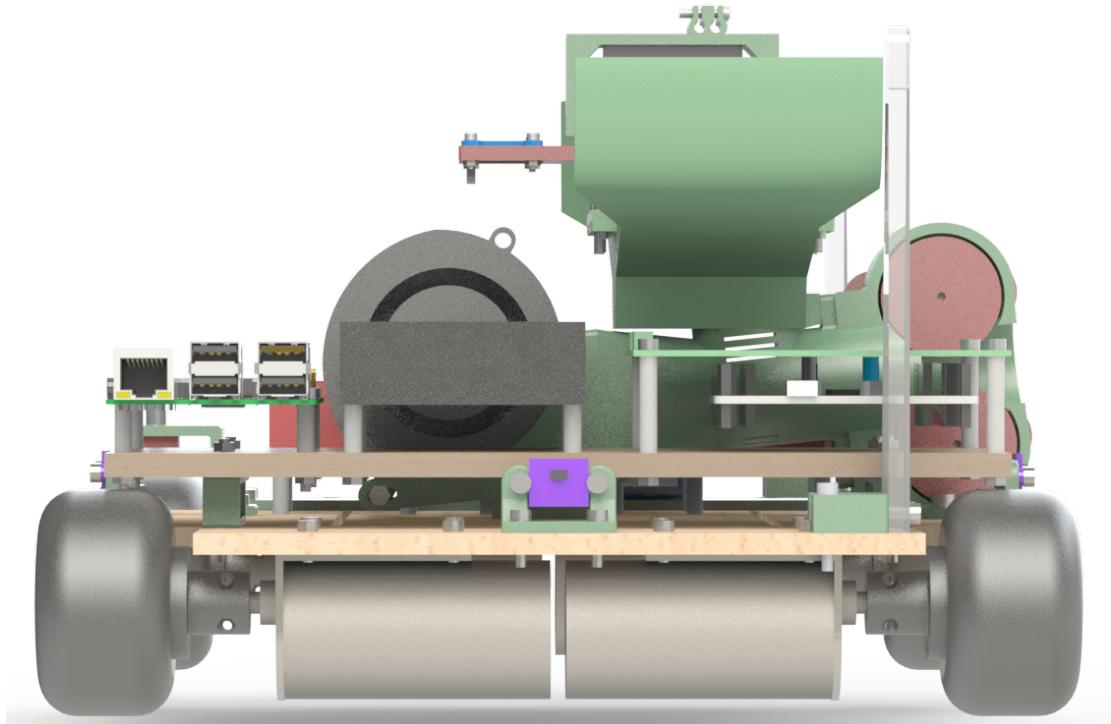

Figure 1.5: Full Robot Render – Right View

The design emphasizes the use of 3D printed parts to take advantage of the benefits of the technology including rapid part production, high part complexity, and low fabrication cost (excluding the cost of the printer, relative to other methods such as machining, casting, and injection molding). Parts were printed on a MakerGear M2 fused deposition modeling (FDM) 3D printer equipped with a 0.35 mm diameter nozzle using MakerGeeks 1.75 mm ABS thermoplastic filament. Print speeds of 20 to 80 mm/s with 0.20 mm layer height, depending on part dimensions and minimum feature size, lead to part print times of 2 to 5 hours for smaller components up to 26 hours for the ball hopper. Due to the non-isotropic strength characteristic of 3D printed components (greater tensile strength in the X and Y axes but significantly weaker in Z), the designs must specifically take into account printing direction and orientation. Additionally, the print volume of 200 mm x 250 mm x 200 mm limits the maximum part dimensions thus requiring the ball hopper to be printed as three separate pieces [8].

1.2 Base Platform

The 315 mm x 275 mm base platform of the robot, made from 1/4" thick medium density fiberboard (MDF), serves as the primary structural component and mounting point for the motors, electronics, shooting mechanism, and hopper. The wood is laser cut with a 20 mm grid of 4 mm diameter holes to allow modular placement of components, and the corner cutouts allow clearance for the wheels. Long slots permit wire routing from the motors to the motor drivers above. Figure 1.6 shows the subassembly with labels.

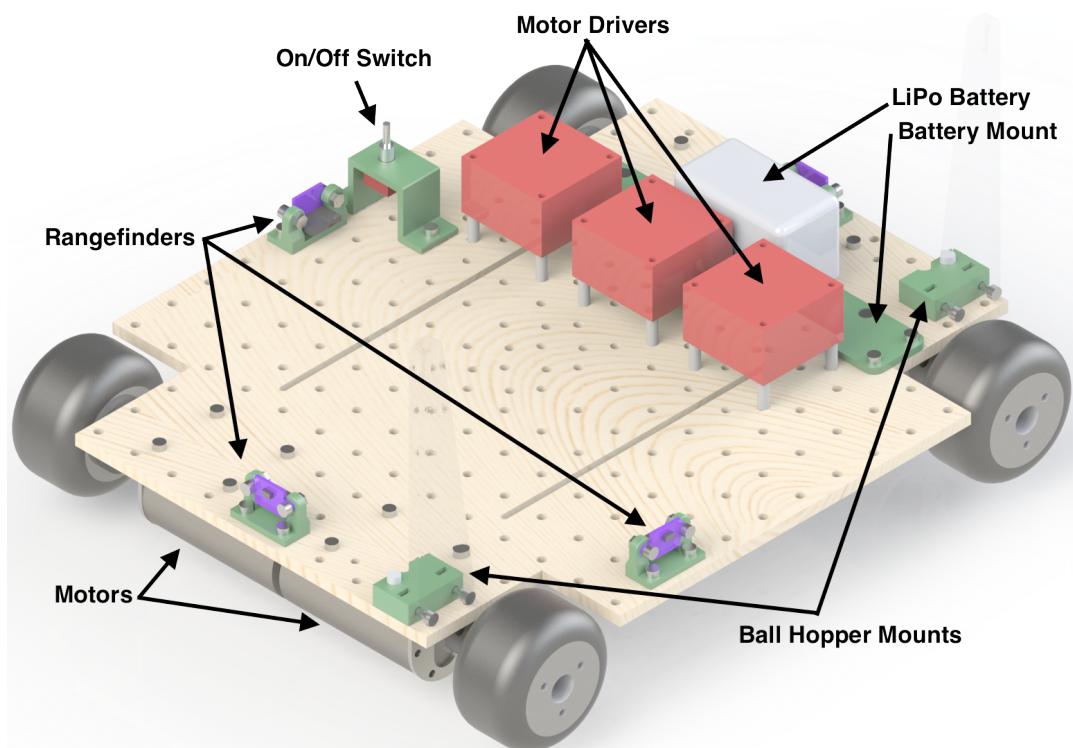

Figure 1.6: Base Platform

Four 12V Pololu 37D motors geared at a 70:1 ratio drive each of the 60 mm diameter mecanum wheels. Figure 1.7 displays an exploded view of the motor assembly. 3D printed couplings, detailed in Figure 1.8, connect the wheels to the 6 mm diameter, D-shaped motor shafts. The couplers use M2 nuts and bolts to clamp onto the motor shaft and an octagonal stub that press fits into the center of the wheels. Three long M3 bolts and nylon lock nuts clamp the mecanum wheels together and to the coupler. Each wheel contains eight angled rollers mounted with two ball bearings each to smooth operation under load. Unlike regular wheels which only produce a force vector perpendicular to the axis, mecanum wheels also produce a vector parallel to the axis. With the appropriate combination of speed and direction of each wheel, the robot can achieve simultaneous translation and rotation in any direction.

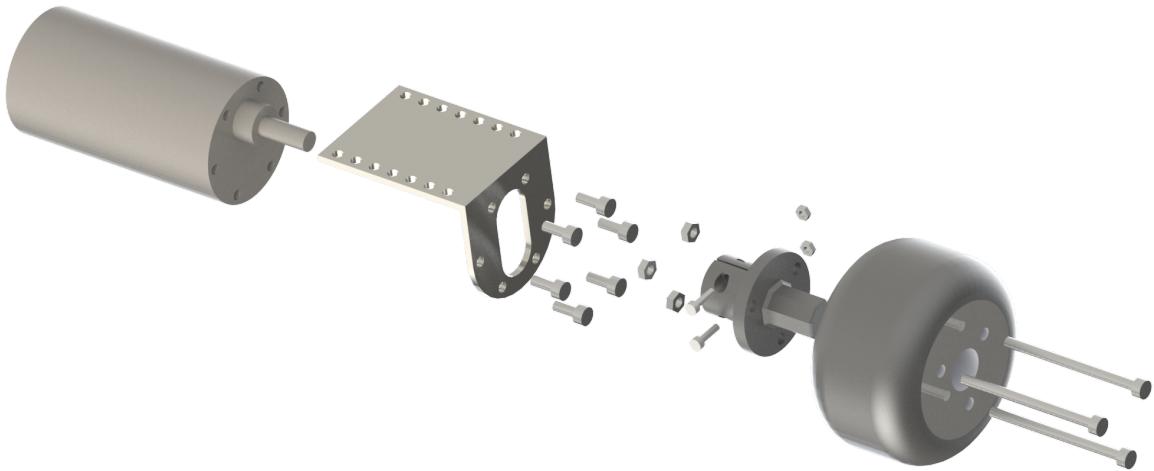

Figure 1.7: Motor Assembly Exploded View

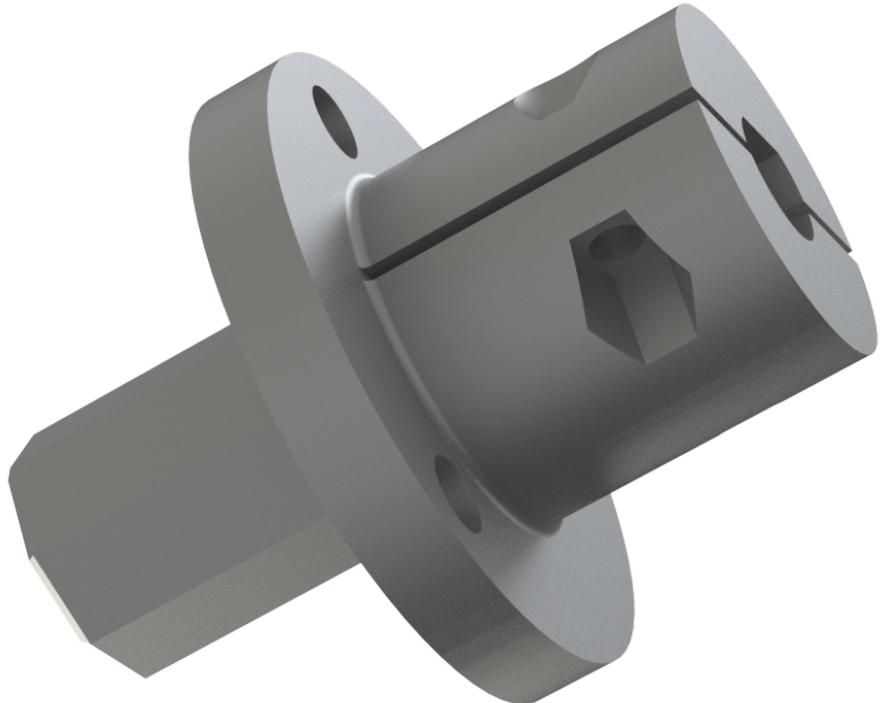

Figure 1.8: Wheel Coupler

Several electronic components are mounted directly on the base platform. Along the four edges of the platform, four STMicroelectronics VL53L0X laser rangefinders seated on 3D printed brackets sense distance. These sensors cost between \$6 to \$20

mounted on a small PCB with supporting circuitry and can sense distances between 30 mm and 2000 mm at a rate of 30 Hz and less than 10% error in most test conditions [16]. A 4S, 1200 mAH LiPo battery mounted with an industrial strength hook-and-loop fastener powers the system through a on/off toggle switch seated in a 3D printed bracket. Three dual H-bridge motor drivers are attached with nylon standoffs and M3 nuts and bolts. Finally, a momentary push button in a 3D printed bracket toggles power to the Raspberry Pi microcomputer.

1.3 Shooting Mechanism

The shooting mechanism naturally takes inspiration from the official Nerf Rival Blaster toys since they're specifically optimized to fire Nerf Rival balls; the system works similarly to a baseball pitching machine. Figure 1.9 shows an exploded view of the subassembly while Figure 1.10 displays the top view. The mechanism consists of two sections: the **barrel** (left green part in Figure 1.9) and the **wheel housing** (right green part in Figure 1.9). Both parts were 3D printed as the geometries are highly complex. Therefore, the shooting mechanism consists of two separate components versus a unibody design to allow each half to be fabricated with optimal print direction, strength, and finish quality. The barrel is angled 6° above horizontal, targeting the vertical center of the nets 6 feet away.

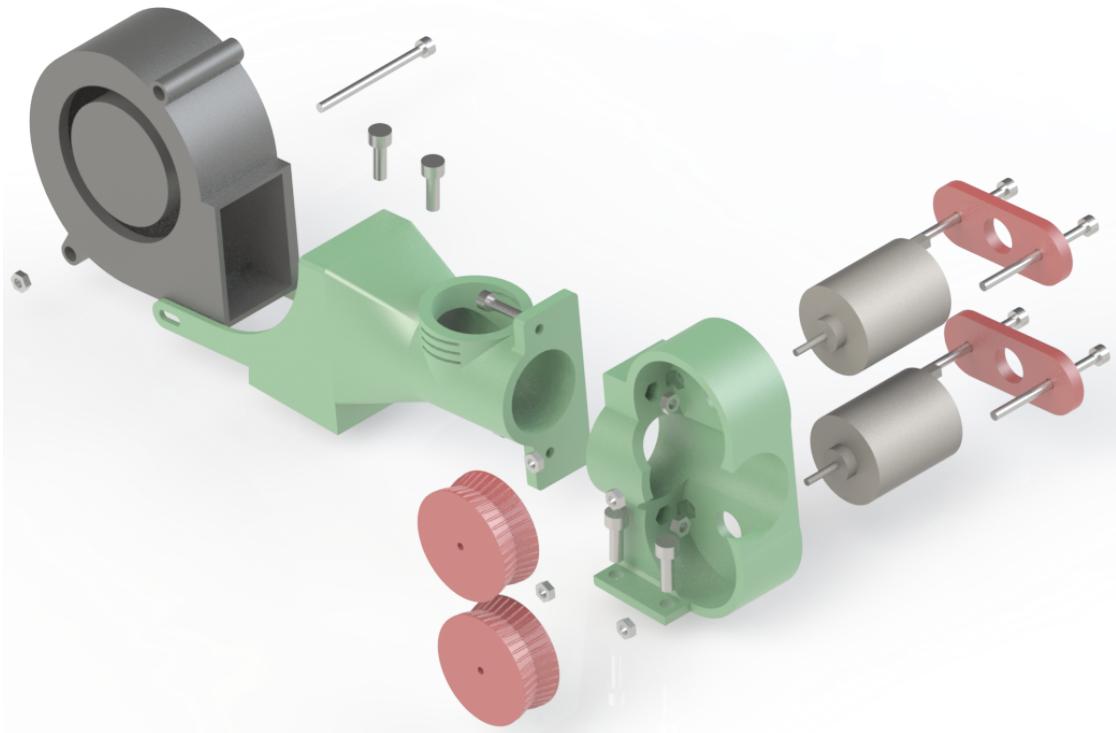

Figure 1.9: Shooting Mechanism – Exploded View

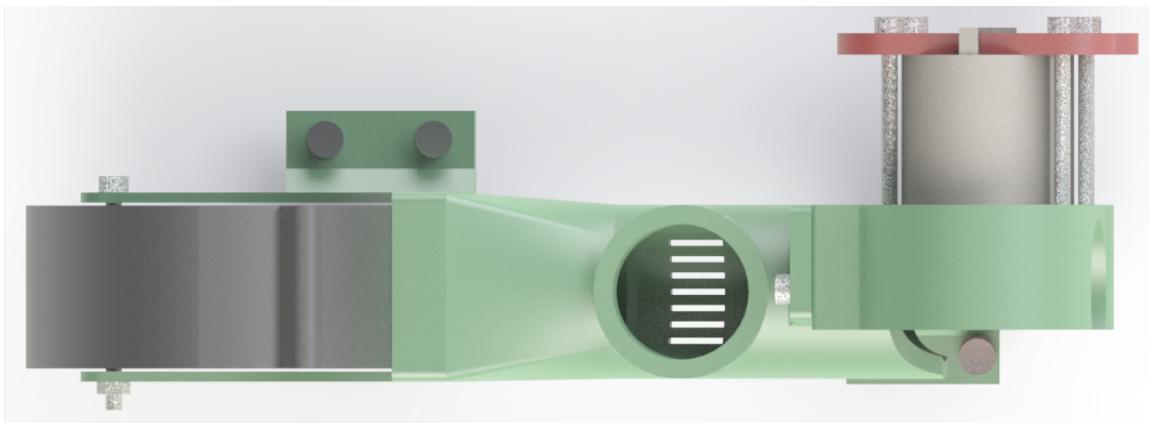

Figure 1.10: Shooting Mechanism – Top View

The **barrel** directs balls from the **ball hopper** to the **wheel housing**. First, the ball enters the barrel through a vertical chute by force of gravity. As the ball falls into the barrel, a high-pressure centrifugal (or blower fan) attached at the back of the barrel pushes it into the wheel housing inlet. As seen in Figure 1.11, the

barrel slightly narrows in the area behind the top chute to prevent the ball from rolling backwards towards the blower fan. A loft feature creates a smooth transition between the rectangular fan inlet and the circular barrel. The foam balls, nominally 23 mm in diameter, would occasionally jam in a 24 mm inner diameter barrel due to ball surface imperfections so the barrel was increased to 25 mm inner diameter. In the initial design, the pressure created by the blower fan was so high that it prevented the ball from falling down the vertical chute. The revised barrel uses strategically placed vents reduce the barrel pressure before the ball enters the chute. As the ball travels down the chute into the barrel, it blocks the vents, increasing the pressure and forcing the itself into the wheel housing.

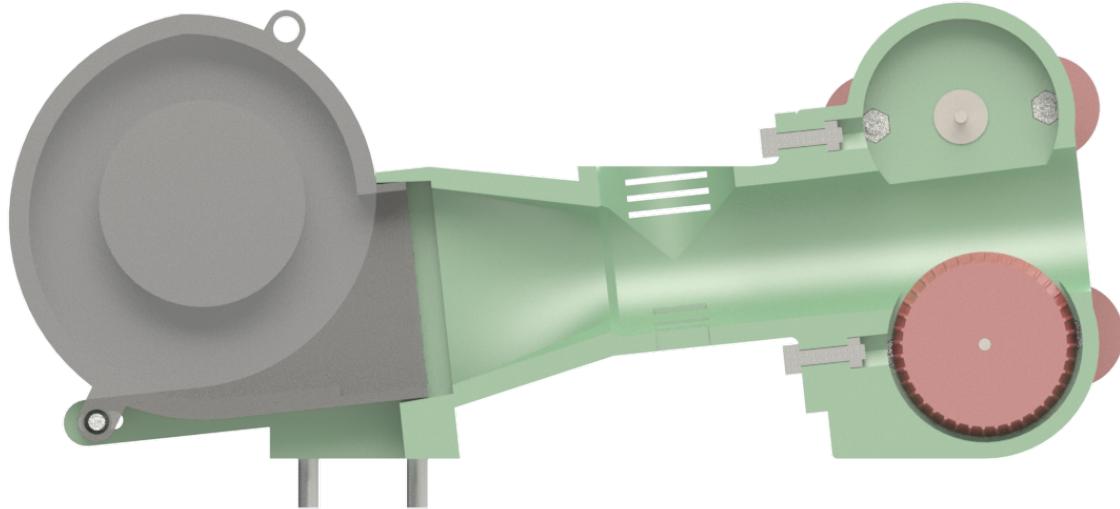

Figure 1.11: Shooting Mechanism – Cross Section View

Inside the **wheel housing**, two counter-rotating 34mm wheels press fitted to two high-speed 12 V motors rapidly accelerate the foam ball up to 50 feet per second. The 14 mm gap between wheels compresses the ball to increase grip, thereby improving energy transfer. The motors lightly press fit into the wheel housing and are secured with 3D printed braces. The perimeter of each 3D printed wheel, detailed in Figure 1.12, consists of a ribbed V-groove to increase the contact patch and grip with the

compressed foam ball. Two "feet" with bolt holes at the bottom of the barrel and wheel housing secure the shooting mechanism to the base platform.

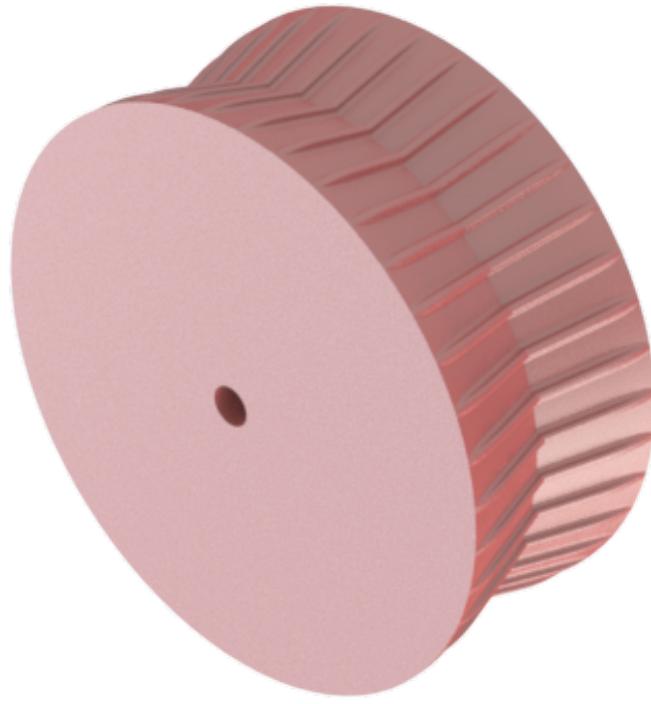

Figure 1.12: Shooting Mechanism – Shooter Wheel

The shooting mechanism performed consistently; in a trial of 100 launches, 100% of balls passed through a 6 inch diameter ring placed 6 feet away where the center of the competition net would be. Since the actual nets are 24 inches in diameter, no further testing was required. The projectile speed averaged 48.1 ft/s with 1.2 ft/s standard deviation as determined with a light gate speed measurement tool after tuning motor speed in the microcontroller.

1.4 Ball Hopper

During the competition, the robot must obtain the foam balls from supply tubes mounted on two sides of the side. The supply tubes consist of two 1" inner diameter

PVC tee joints and an eyebolt. The bottoms of the supply tubes are positioned seven inches above the floor and a swinging flap holds the balls in as shown in Figure 1.13. The ball hopper, shown in Figure 1.14 is a large 3D printed component designed to push the swinging flap away, collect the balls, store them, and dispense them into the shooting mechanism. Figure 1.15 shows an exploded view of the subassembly.

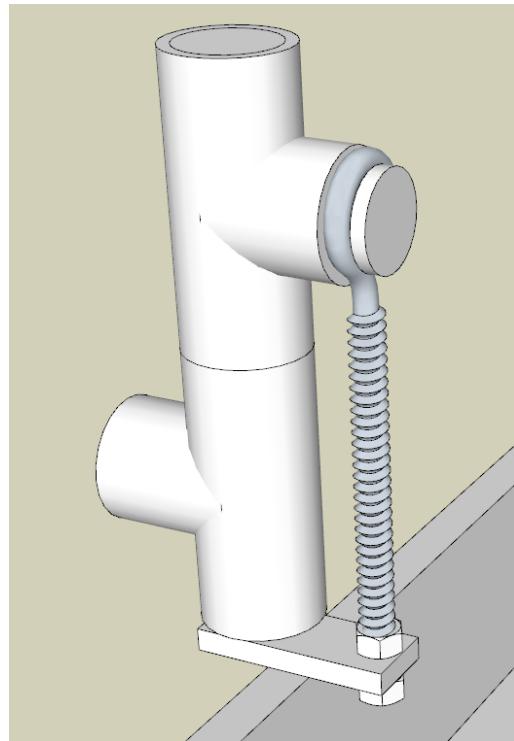

Figure 1.13: Supply Tube

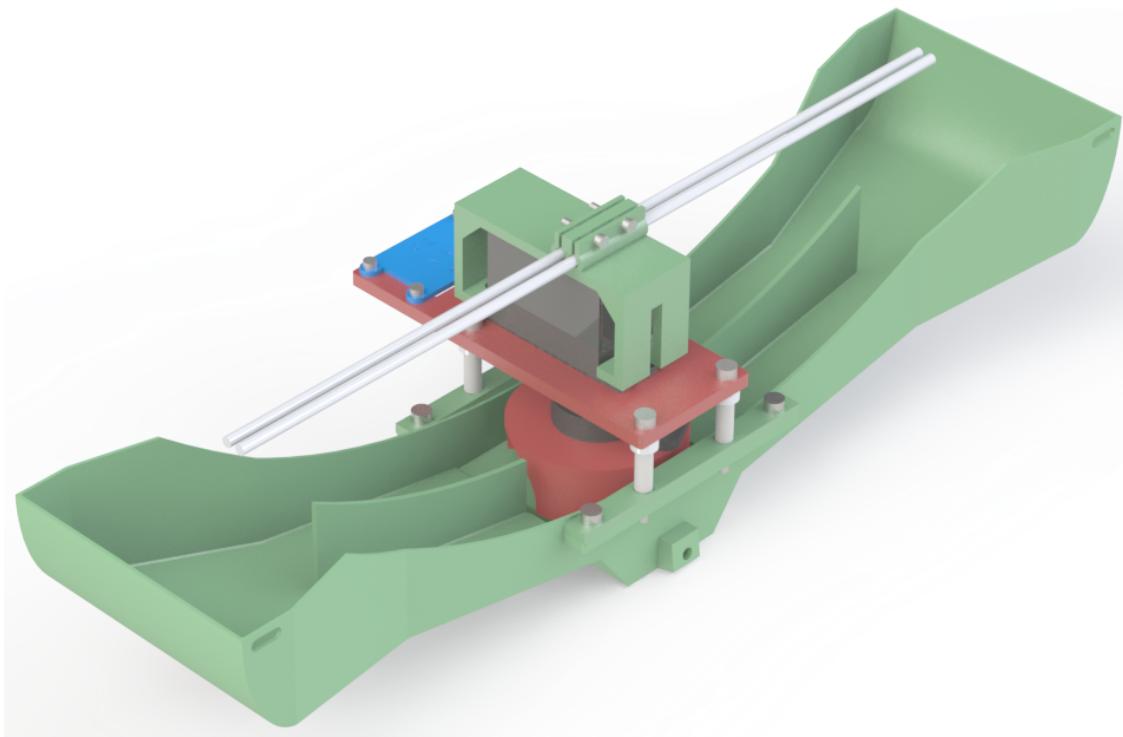

Figure 1.14: Ball Hopper

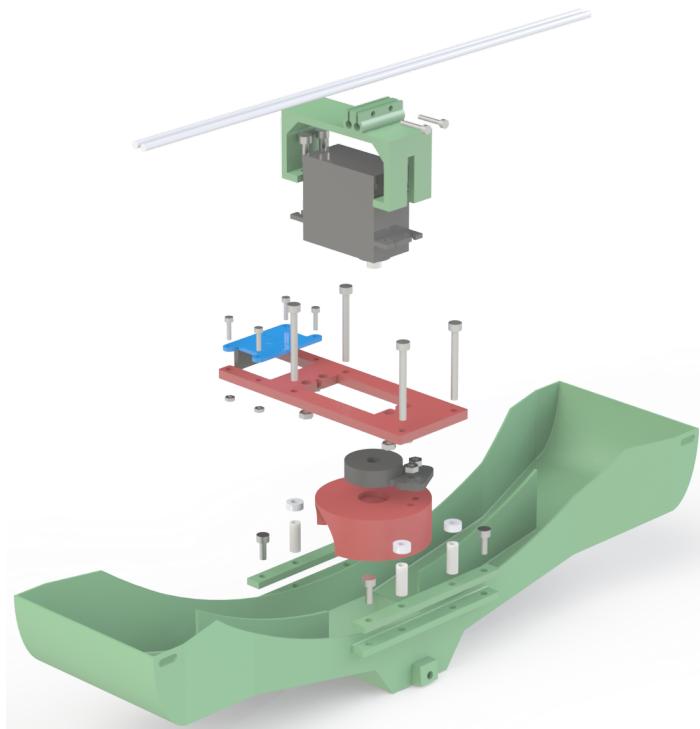

Figure 1.15: Ball Hopper – Exploded View

To obtain balls, the robot first positions itself such that the wide portion of hopper resides next to the supply tube. The robot then moves such that the metal rods at the top of the ball hopper push the eyebolt aside. As the flap swings open, the balls roll out of the supply tube and down the steep sloped portion of the hopper. Visible in the cross section view of Figure 1.16, the slope rapidly becomes shallower in order to convert the balls' downward momentum into sideways momentum which keeps balls from jamming against each other. The balls then roll into one of two channels before stopping at the dispensing gate.

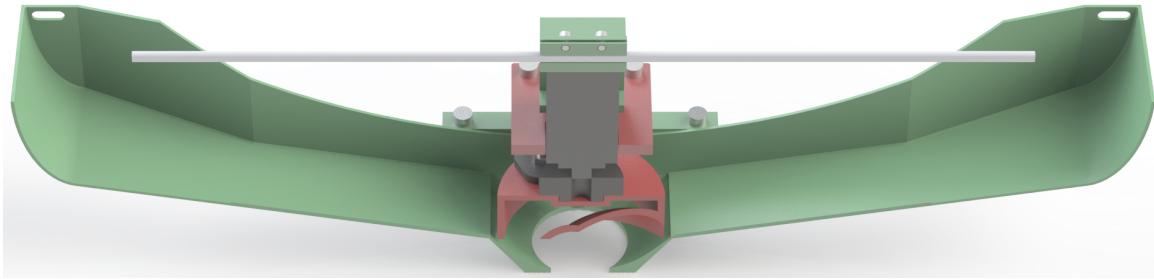

Figure 1.16: Ball Hopper – Cross Section View

The dispensing gate, shown in Figure 1.17, controls the movement of balls between hopper channels and the shooting mechanism entrance. Its complex shape directs balls into the hole at the bottom of the ball hopper from one channel at a time to prevent jamming. A standard 180° rotation servo, mounted in a 3D printed bracket above the center of the hopper, controls the dispensing gate. Fastened to the same bracket, an inertial measurement unit (IMU) measures magnetic compass heading and acceleration in three dimensions. The ball hopper is mounted at three points: the top of the shooting mechanism and the left and right edges of the robot using 3D printed and acrylic braces shown in Figure 1.18.

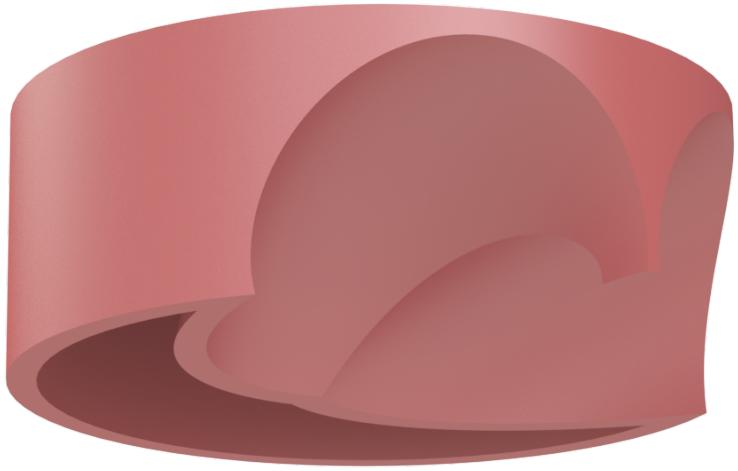

Figure 1.17: Ball Hopper – Dispensing Gate

Figure 1.18: Ball Hopper – Braces

1.5 Control Unit

The control unit, shown in Figure 1.19, consists of a 1/4" MDF board with various electronic components mounted: two off-the-shelf DC-DC switching converters, a custom interconnect printed circuit board (PCB), an off-the-shelf STM32 Nucleo-64 development board, and the Raspberry Pi microcomputer. Two 3D printed standoffs, the green parts shown in Figure 1.20, connect the control unit to the platform and raise it slightly to avoid colliding with the robot's wheels.

* The pin is affected with an I/O function

** The pin is affected with a peripheral function but no peripheral mode is activated

4. Clock Tree Configuration

5. IPs and Middleware Configuration

5.1. I2C2

I2C: I2C

5.1.1. Parameter Settings:

Master Features:

I2C Speed Mode	Fast Mode *
I2C Clock Speed (Hz)	400000
Fast Mode Duty Cycle	Duty cycle Tlow/Thigh = 2

Slave Features:

Clock No Stretch Mode	Disabled
Primary Address Length selection	7-bit
Dual Address Acknowledged	Disabled
Primary slave address	0
General Call address detection	Disabled

5.2. I2C3

I2C: I2C

5.2.1. Parameter Settings:

Master Features:

I2C Speed Mode	Fast Mode *
I2C Clock Speed (Hz)	400000
Fast Mode Duty Cycle	Duty cycle Tlow/Thigh = 2

Slave Features:

Clock No Stretch Mode	Disabled
Primary Address Length selection	7-bit
Dual Address Acknowledged	Disabled
Primary slave address	0
General Call address detection	Disabled

5.3. RCC

High Speed Clock (HSE): Crystal/Ceramic Resonator

Low Speed Clock (LSE) : Crystal/Ceramic Resonator

5.3.1. Parameter Settings:

System Parameters:

VDD voltage (V)	3.3
Instruction Cache	Enabled
Prefetch Buffer	Enabled
Data Cache	Enabled
Flash Latency(WS)	5 WS (6 CPU cycle)

RCC Parameters:

HSI Calibration Value	16
TIM Prescaler Selection	Disabled
HSE Startup Timeout Value (ms)	100
LSE Startup Timeout Value (ms)	5000

Power Parameters:

Power Regulator Voltage Scale	Power Regulator Voltage Scale 1
Power Over Drive	Enabled

5.4. SYS

Timebase Source: SysTick

5.5. TIM3

Clock Source : Internal Clock

Channel1: PWM Generation CH1

Channel2: PWM Generation CH2

5.5.1. Parameter Settings:

Counter Settings:

Prescaler (PSC - 16 bits value)	1 *
Counter Mode	Up
Counter Period (AutoReload Register - 16 bits value)	2047 *
Internal Clock Division (CKD)	No Division

Trigger Output (TRGO) Parameters:

Master/Slave Mode	Disable (no sync between this TIM (Master) and its Slaves)
Trigger Event Selection	Reset (UG bit from TIMx_EGR)

PWM Generation Channel 1:

Mode	PWM mode 1
Pulse (16 bits value)	0
Fast Mode	Disable
CH Polarity	High

PWM Generation Channel 2:

Mode	PWM mode 1
Pulse (16 bits value)	0
Fast Mode	Disable
CH Polarity	High

5.6. TIM4

mode: Clock Source**Channel1: PWM Generation CH1****Channel2: PWM Generation CH2****Channel3: PWM Generation CH3****Channel4: PWM Generation CH4****5.6.1. Parameter Settings:****Counter Settings:**

Prescaler (PSC - 16 bits value)	1 *
Counter Mode	Up
Counter Period (AutoReload Register - 16 bits value)	2047 *
Internal Clock Division (CKD)	No Division

Trigger Output (TRGO) Parameters:

Master/Slave Mode	Disable (no sync between this TIM (Master) and its Slaves)
Trigger Event Selection	Reset (UG bit from TIMx_EGR)

PWM Generation Channel 1:

Mode	PWM mode 1
Pulse (16 bits value)	0
Fast Mode	Disable
CH Polarity	High

PWM Generation Channel 2:

Mode	PWM mode 1
------	------------

Pulse (16 bits value)	0
Fast Mode	Disable
CH Polarity	High

PWM Generation Channel 3:

Mode	PWM mode 1
Pulse (16 bits value)	0
Fast Mode	Disable
CH Polarity	High

PWM Generation Channel 4:

Mode	PWM mode 1
Pulse (16 bits value)	0
Fast Mode	Disable
CH Polarity	High

5.7. TIM5

mode: Clock Source

5.7.1. Parameter Settings:

Counter Settings:

Prescaler (PSC - 16 bits value)	9000 *
Counter Mode	Up
Counter Period (AutoReload Register - 32 bits value)	0xFFFFFFFF *
Internal Clock Division (CKD)	No Division

Trigger Output (TRGO) Parameters:

Master/Slave Mode	Disable (no sync between this TIM (Master) and its Slaves)
Trigger Event Selection	Reset (UG bit from TIMx_EGR)

5.8. TIM12

mode: Clock Source

Channel1: PWM Generation CH1

Channel2: PWM Generation CH2

5.8.1. Parameter Settings:

Counter Settings:

Prescaler (PSC - 16 bits value)	354 *
Counter Mode	Up
Counter Period (AutoReload Register - 16 bits value)	3178 *
Internal Clock Division (CKD)	No Division

PWM Generation Channel 1:

Mode	PWM mode 1
Pulse (16 bits value)	63 *
Fast Mode	Disable
CH Polarity	High

PWM Generation Channel 2:

Mode	PWM mode 1
Pulse (16 bits value)	63 *
Fast Mode	Disable
CH Polarity	High

5.9. USART2

Mode: Asynchronous

5.9.1. Parameter Settings:

Basic Parameters:

Baud Rate	921600 *
Word Length	8 Bits (including Parity)
Parity	None
Stop Bits	1

Advanced Parameters:

Data Direction	Receive and Transmit
Over Sampling	16 Samples

* User modified value

8. Software Project

8.1. Project Settings

Name	Value
Project Name	firmware_new
Project Folder	/Users/justinng/Documents/Github/robordentia2017/firmware_new
Toolchain / IDE	Makefile
Firmware Package Name and Version	STM32Cube FW_F4 V1.18.0

8.2. Code Generation Settings

Name	Value
STM32Cube Firmware Library Package	Copy all used libraries into the project folder
Generate peripheral initialization as a pair of '.c/.h' files	Yes
Backup previously generated files when re-generating	No
Delete previously generated files when not re-generated	Yes
Set all free pins as analog (to optimize the power consumption)	No
